We need to install the Windows 10 ISO file from the "Storage" tab to be able to run it.

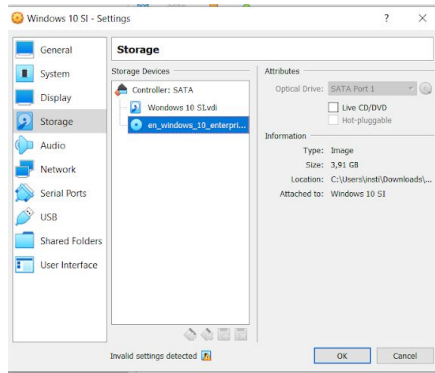

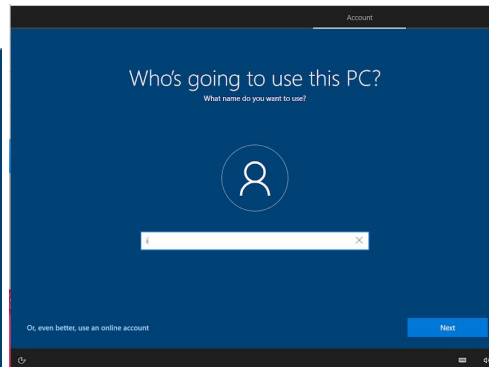

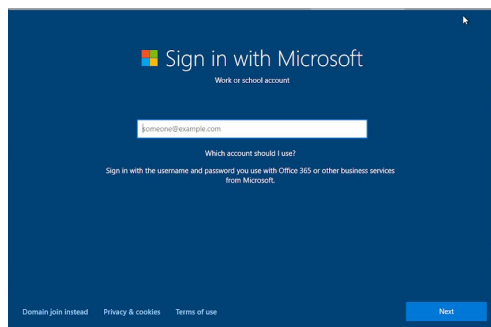

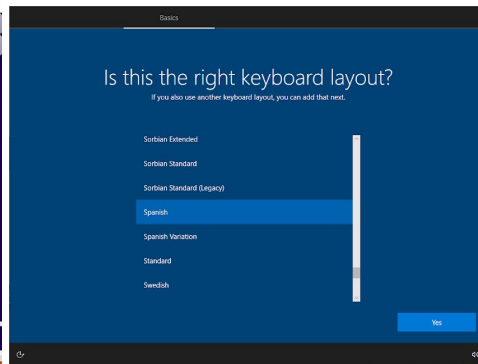

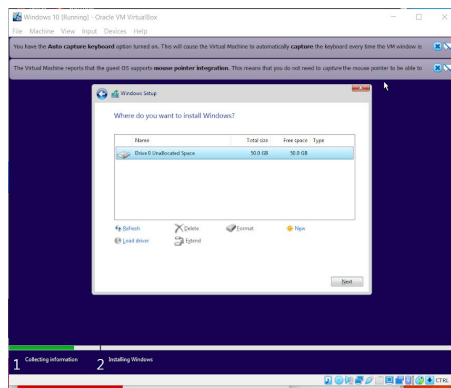

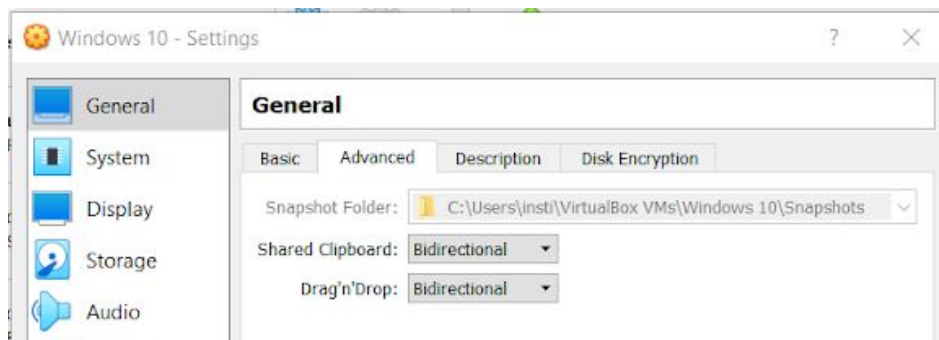

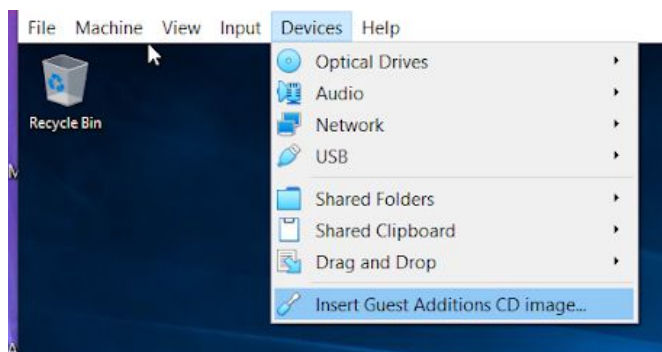

Then we set up the configuration for Windows 10
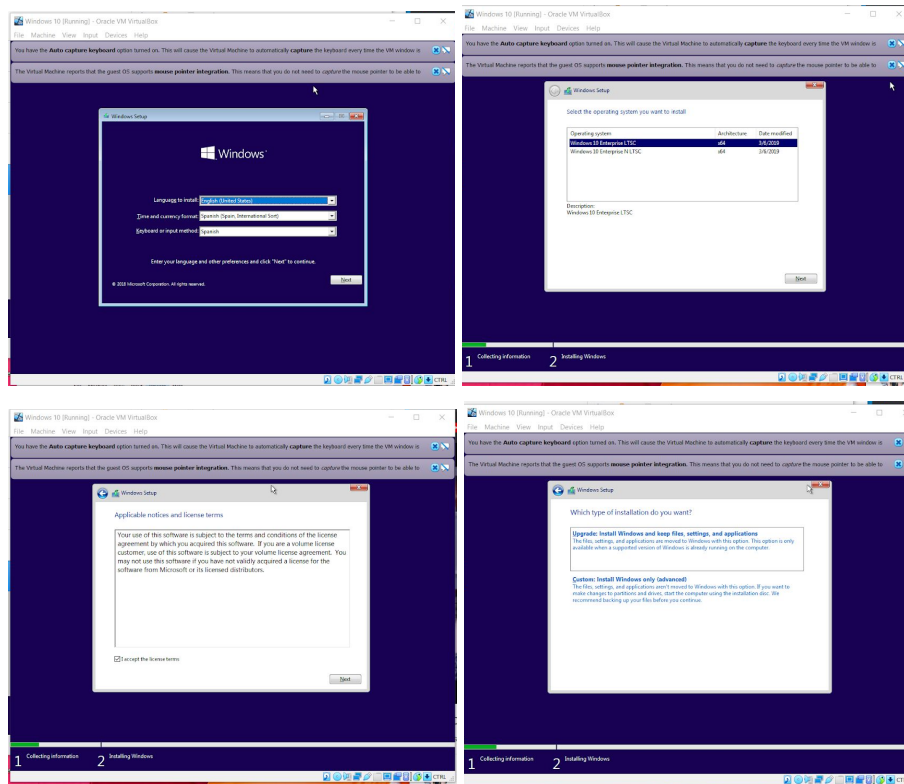

We set up "Guest additions" by going to "Devices" and inserting a CD image when we have the machine open,then we go to "Settings and change the clipboard in the general option to "Bidirectional"

On the shared folder we have to select the source directory we want to use, we use the auto-mount so we don't have to configure anything else.
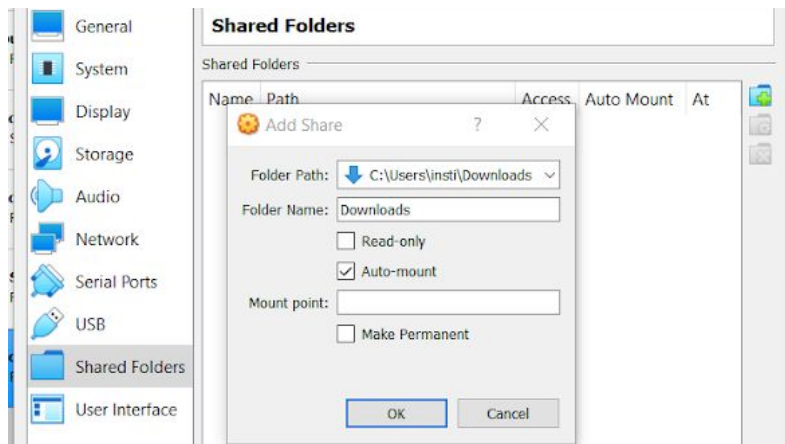

We change the type of network by going to "Settings>network" and we change it to "Bridge Adapter" so it connects to the rest of devices on the network.
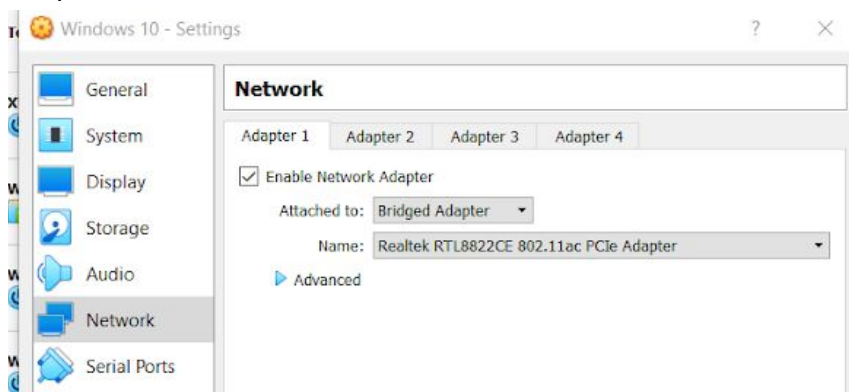

Then we set up the USB 3.0 for which we need to install an extension of VirtualBox
